

The Unified Operational Layer for Phase I–III Clinical Trials

Consolidate EDC, point-of-care eSource (SMR), eISF, eTMF, and CTMS into a single GxP-validated platform. Eliminate manual transcription and stop paying the legacy software tax.

THE OPERATIONAL CHALLENGE

Bringing life-saving therapies to market is bogged down by fragmented vendor stacks. Traditional clinical trials require separate systems for data capture, site documents, and trial management—leading to expensive integrations, massive administration burdens, and site staff turnover rates as high as 61%.

ClinCove provides a seamless, GxP-compliant platform that unites sites, sponsors, and CROs under a single digital roof. Deploy studies in weeks, capture verified data directly at the source, and ensure constant audit readiness.

CORE PLATFORM CAPABILITIES

- ✓ **Protocol AI & Automation**
Upload trial protocol PDFs to instantly auto-generate CDISC-compliant Case Report Forms (CRFs), custom edit checks, and full clinical visit schedules in hours instead of weeks.
- ✓ **Point-of-Care eSource (SMR) & EDC**
Capture clinical trial data directly during patient visits. Our smart digital medical records sync instantly with the EDC, preventing manual transcription and side-by-side data queries.
- ✓ **Unified eISF & eTMF Synchronicity**
Investigator Site Files and Trial Master Files communicate in real-time. Document uploads automatically index with OCR and TMF reference standards for absolute compliance.

QUANTIFIABLE TRIAL IMPACT

- 75% Study Build Time**
Deploy EDC in 2–4 weeks compared to traditional 12-week cycles.
- 80% Data Queries**
Eliminate transcription errors with point-of-care source data validation.
- 60% Integration Costs**
Consolidate up to 4 legacy vendor software contracts into 1 unified platform.
